

LOVELL HIGH SCHOOL – Master Plan | Lovell, Wyoming

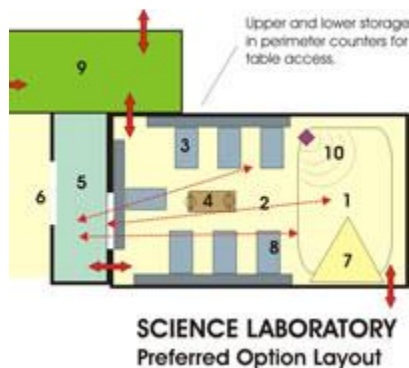

The Lovell community had been waiting many years for state funding for a new replacement high school. Declining enrollments and limited state funding placed this project lower and lower on the state priority list.

Franklin Hill & Associates was commissioned to explore options including renovation of the existing facility. After careful analysis with staff, administration, and community, the Hill Master Plan solution proved to provide all the educational expectations of a “school of the future” within the existing building.

The solution included:

- Small learning communities
- Collegiate resource spaces
- Advanced science laboratories
- Integrated technology education and career training, and an
- Expanded performing arts area

Most importantly, the solution was at a substantial savings in construction cost. Thus, this project was funded 10 years earlier, and is now under design and construction in the district.

This project demonstrated the importance of understanding and applying appropriate future trends in learning to existing buildings in a manner that reduces total project cost.

Numerous articles have been published about this project.
